(54) Title: SIDE BRUSH

(57) Abstract: The invention relates to a side brush, which is adapted to be mounted on the body of a sweeping machine, for use as a brush rotatable (W) about a rotation axis (V), and which comprises a base element (1) and a plurality of individual bristle segments (2) detachably mountable thereto, having bristles (2a') included therein integrated for a solid unit with a frame member (2a'') joining the same. The base element (1) comprises a substantially planar disc assembly which is provided integrally with a coupling system for coupling the bristle segments (2) therewith on a snap fit principle. The coupling system is implemented by means of elongated channels (U) disposed in the base element (1) in a substantially radial direction (R) and extending through the base element, opening all the way to the edge thereof, which enable coupling the bristle segments (2) immovably to the segment with the body of a sweeping machine by means of the base element (1) with fasteners (3) interconnecting the same, such as in a screw clamping or suchlike fashion.
